PET/CT Fusion

FAST FUSION OF FUNCTIONAL AND ANATOMIC DATA

The PET/CT Fusion protocol provides flexible and quick image overlay analysis. Standard Uptake Value (SUV) calculations are enabled with regions and volumes of interest (ROIs and VOIs).

Key features:

- Registration controls for any position and size differences between datasets
- View multiple images and slice axes simultaneously
- Multiple ROIs yield SUV data from different regions simultaneously
- Open PET, MRI or NM functional data with CT or MRI anatomical data for fusion

Radius: 10mm
